

# New Forceteq® pro, force measurement with high precision

## Express

Force Measurement Technology now even more precise with **Forceteq® pro**, Signateq® measurement amplifier und external DMS force sensor.

Dear ,

With our Forceteq® Technology you can control the force during the production process. In this way, errors are already detected in the production phase.

There are 2 versions of Forceteq® now available:

The **Forceteq® basic** force measurement technology is based on calibrated current measurement and is completely integrated in the XENAX® Xvi servo controller. Force measurement is taken during the production process without an additional sensor. You can capture and record force-distance diagrams.

New **Forceteq® pro**, this force measurement technology works with our new Signateq® measurement amplifier and an external strain gauge force sensor. This makes the measurement and control accuracy even more precise. This is particularly useful when sensitive parts are to be mounted, moved or placed.

More information and a demonstration video of **Forceteq® basic** can be found on our [Website](#).

For specific information, please contact our experts.
